Sub-Committee 4 Freight containers - Marking, Coding, Communication

deals with the software of the container system. It has three working groups:

- WG 1 Optical markings and their coding: This group deals with the decals to be marked on the outside of the container showing its identity, its type and size, its maximum gross weight/mass, tare weight/mass, maximum payload, cubic capacity, and as far as applicable warning marks, and the coding of such data.
- WG 2 Automatic equipment identification deals with the specification of systems that allow for automatic reading of the identity of the container and of other permanent container related data, with the coding of the data sequence transmitted to a reading device, and with techniques and procedures near to these functions such as automatic recognition of container seal's integrity.
- WG 3 Communication has established a comprehensive list of codes and definitions for spare parts of the container, its damages (type, size, location), repair needs, repair actions and the more. The functions of these standards are described in chapter 1.2. Initially, this working group discussed related messages and message structures for container related communication. But this function was transferred to the EDIFACT Board in mutual consensus.

1.1.2.2 Current standards of TC 104

ISO TC 104 has over the last 35 years elaborated many standards. Most of them are in wide use today and are well applied by the transportation industry.

This is by far not a common feature. All international standards are voluntary in their application, and the industry is, generally speaking, free to apply an International Standard or to take their individual solution. In container transport, most ISO standards are applied, but not always in all details. The following report will give information of the nature of the various standards and some considerations about their current application.

All standards are designed by a number attached to them by ISO Central Secretariat. The individual number is followed by the year in which the most recent version of a standard has been accepted.

ISO 668: 1988 Series 1 freight containers - Classification, dimensions and ratings

with some later amendments, mainly inserting the 2900 mm high containers.

ISO 668 is a basic standard in the field of container transport, giving the outside dimensions, the positioning of the corner fittings and the maximum gross mass. These values and dimensions are orientation points for other technical systems and their interface: Cellular ships are designed to the outside dimensions of containers and their tolerances, cranes are designed to their lifting capacity taking note of the maximum gross weight of containers, spreaders are designed to lift the container at the top corner fitting location, railcar and chassis twist lock locations are placed in conformity of ISO 668 bottom corner fitting location.
